# BARRIERS

FUNCTIONAL

# Functional barriers

- A new product is a new way of doing. A value needs to be highlighted to motivate a change.
- A user comes with an intention of solving a problem and not of using EPOS. The Portal is (more than) a very nice demonstrator and an help to use a service independently.
- The new generation scientists are often developpers. In the cube of EPOS they may use directly ICS.

# Technical barriers

- Range of data existing and catalogued (degree of deployment and also question of legal issues). Between data and TCS, actions are needed in all the fields, not only those mentioned in the contract.
- Shape of the data (in some thematics the processing and shape of data are not within usual way to proceed).
- Data quality not guaranteed because EPOS-ERIC is not a data repository but an central integration hub

# BARRIERS

CULTURAL

# Cultural barriers

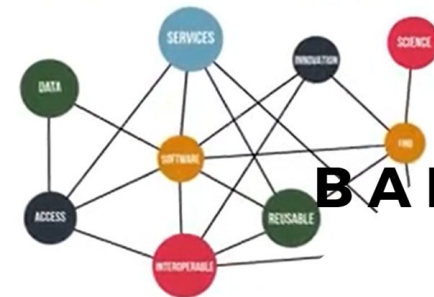

- Habits: why would a user come and use EPOS when he has his own solutions and habits to chain the data access, processing and representation?
- Cultural barrier means also trust to a data provider. How can the user be sure the data quality is as good as the user's end point habits? (what about the trust of processing results if one is not confident in the quality of the data ?).
- Communities may produce and transfer their data using their own formal or informal channels.

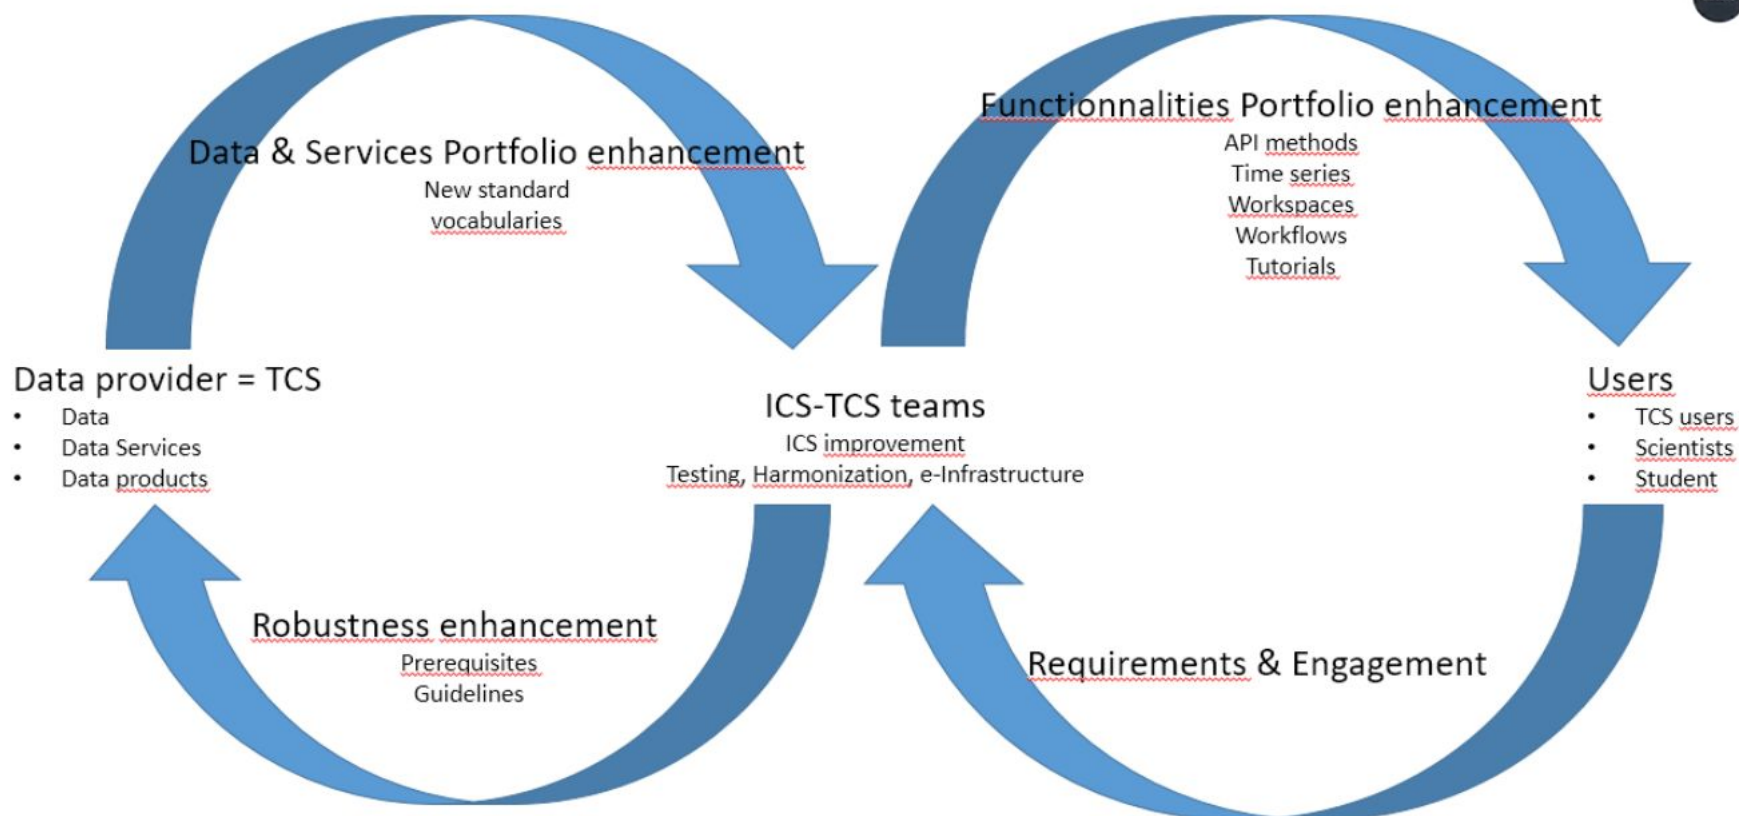

# BARRIERS

MITIGATION PATHS

# Preventing and mitigating

## • Continuous animation

# Preventing and mitigating

- Functional and technical: Pilot Operational Testing
- Technical: a referenced dataset is an accessible dataset
- Scientific excellence (assessment of scientific impact...)
- Making access and integration of data and services not available without EPOS
- Exploitation of new and innovative services
- Registration of EPOS in all national roadmaps
- EPOS is a change of paradigm in the use of the data: many thematic services, one end point. The innovation is a keypoint and EPOS is not a substitute to a list of TCS
